

Copper: Preliminary Data for August 2013

The International Copper Study Group (ICSG) released preliminary data for August 2013 world copper supply and demand in its November 2013 Copper Bulletin. The Bulletin is available for sale upon request.

In developing its global market balance, ICSG uses an apparent demand calculation for China, the leading global consumer of copper, accounting for about 40% of world demand. Apparent copper demand for China is based only on reported data (production + net trade +/- SHFE stock changes) and does not take into account changes in unreported stocks [State Reserve Bureau (SRB), producer, consumer and merchant/trader], which may be significant during periods of stocking or de-stocking and which could significantly alter supply-demand balances.

According to preliminary ICSG data, the refined copper market balance for August 2013 showed a small production surplus of 21,000 metric tonnes (t). When making seasonal adjustments for world refined production and usage, August showed a production surplus of 3,000 t. The refined copper balance for the first eight month of 2013, including revisions to data previously presented, indicates a production deficit of 45,000 t (a seasonally adjusted surplus of 76,000 t). This compares with a production deficit of 567,000 t (a seasonally adjusted deficit of 450,000 t) in the same period of 2012.

In the first eight months of 2013, world usage is estimated to have increased by 1.9% (266,000 t), compared with that in the same period of 2012. Despite July-August's high levels, Chinese apparent demand in the first eight months only increased by 3.6% from that in the same period of 2012 as a result of a 22% (475,000 t) decline in net imports of refined copper. However, anecdotal evidence suggests that the lower import level was accompanied by a decline in unreported inventories held in bonded warehouses in China, which may have been all or partially directed to domestic industrial use. (In its April 26th forecast press release ICSG said that unreported inventories in China were estimated to have risen by about 600,000 t during 2012). Excluding China, year-on-year world usage increased by 0.7%, with growth in the United States, the Gulf countries, Brazil and Russia offsetting declines in Japan and the European Union. On a regional basis, usage is estimated to have declined by around 1% in Africa and 4% in Oceania and to have increased by 4% in the Americas, 2% in Asia and 1% in Europe.

World mine production is estimated to have increased by 8.8% (943,000 t) in the first eight months of 2013 compared with that in the same period of 2012, mainly owing to a recovery in production levels from constrained output in early 2012. Concentrate production increased by 10% (854,000 t) and solvent extraction-electrowinning (SX-EW) by 4% (89,000 t). Mine production increased by around 7% in Chile (246,000 t), the world's leading producer, and accounted for 32% of world mine production. Production also increased in Peru (6%), the United States (8.5%), Indonesia (10%), Democratic Republic of Congo (51%) and Zambia (14%) among others. On a regional basis, production rose by around 28% in Africa, 7% in the Americas, 10% in Asia, 2.5% in Europe, and 8% in Oceania. The average world mine capacity utilization rate for the first eight months of 2013 increased to around 82.5% from around 79.5% in the same period of 2012, with August 2013 presenting a rate of 85%.

World refined production is estimated to have increased by around 6% (788,000 t) in the first eight months of 2013 compared with refined production in the same period of 2012: primary production was up by around 5% (526,000 t), and secondary production (from scrap) increased by 11% (262,000 t). The main contributor to growth was China, where production increased by 15.5% (580,000 t). Production also increased significantly in Brazil (75%), the Democratic Republic of Congo (40%), and Zambia (14%). However, due to smelter maintenance and other temporary shutdowns, refined production declined by 6% in Chile, the world's second largest refined copper producer, 20% in India, 2% in Japan, and 6.5% in Scandinavia. On a regional basis, refined production is estimated to have increased in Africa (25%), Asia (9%), Oceania (1.5%) and the Americas (1.5%) and remained unchanged in Europe. The average world refinery capacity utilization rate for the first eight months of 2013 improved slightly to 78.7% from 78.1% recorded for the same period a year ago.

The average LME cash price for October 2013 was US\$7,188.74 per tonne, up from the September 2013 average of US\$7,161.43 per tonne. The 2013 high and low copper prices through the end of October were US\$8,242.50 (on 5 Feb) and US\$6,637.50 per tonne (on 24 June), respectively, and the annual average was US\$7,358.55 per tonne. As of the end of October, copper stocks held at the major metal exchanges (LME, COMEX, SHFE) totalled 672,448 t, an increase of 83,026 t from stocks held at the end of December 2012 and a decline of 40,084 t from stock levels at the end of September 2013. Compared with the September levels, stocks were down at LME and COMEX and up at SHFE.

Please visit the ICSG website www.icsg.org for further copper market related information.

World Refined Copper Usage and Supply Trends, 2008-2013

Thousand metric tonnes, copper

Due to the nature of statistical reporting, the published data should be considered as preliminary as some figures are currently based on estimates and could change
 1/ Based on EU apparent usage. 2/ Surplus/deficit is calculated using refined production minus refined usage. 3/ Surplus/deficit is calculated using seasonally adjusted refined production minus seasonally adjusted refined usage.
